metamaterials are advanced composite materials which have exotic and powerful properties their complicated microstructures make metamaterials challenging to model requiring the use of sophisticated mathematical techniques this book uses a from first principles approach based on boundary integral methods and asymptotic analysis to study a class of high contrast metamaterials these mathematical techniques are applied to the problem of designing graded metamaterials that replicate the function of the cochlea

an increasing complexity of models used to predict real world systems leads to the need for algorithms to replace complex models with far simpler ones while preserving the accuracy of the predictions this three volume handbook covers methods as well as applications this third

volume focuses on applications in engineering biomedical engineering computational physics and computer science

this book delves into the recent findings and research methods in the existence and regularity theory for non newtonian fluids with variable power law the aim of this book is not only to introduce recent results and research methods in the existence and regularity theory such as higher integrability higher differentiability and holder continuity for flows of non newtonian fluids with variable power laws but also to summarize much of the existing literature concerning these topics while this book mainly focuses on steady state flows of non newtonian fluids the methods and ideas presented in this book can be applied to unsteady flows as discussed in chapter 7 and other related problems such as complex non newtonian fluids plasticity elasticity $p \times$ laplacian type systems and so on the book is intended for researchers and graduate students in the field of mathematical fluid mechanics and partial differential equations with variable exponents it is expected to contribute to the advancement of mathematics and its applications

nonlinear evolution equations are widely used to describe nonlinear phenomena in natural and social sciences however they are usually quite difficult to solve in most instances this book introduces the finite difference methods for solving nonlinear evolution equations the main numerical analysis tool is the energy method this book covers the difference methods for the initial boundary value problems of twelve nonlinear partial differential equations they are fisher equation burgers equation regularized long wave equation korteweg de vries equation camassa holm equation schrödinger equation kuramoto tsuzuki equation zakharov equation ginzburg landau equation cahn hilliard equation epitaxial growth model and phase field crystal model this book is a monograph for the graduate students and science researchers majoring in computational mathematics and applied mathematics it will be also useful to all researchers in related disciplines

this book on finite element based computational methods for solving incompressible viscous fluid flow problems shows readers how to apply operator splitting techniques to decouple complicated computational fluid dynamics problems into a sequence of relatively simpler sub problems at each time step such as hemispherical cavity flow cavity flow of an oldroyd b viscoelastic flow and particle interaction in an oldroyd b type viscoelastic fluid efficient and robust numerical methods for solving those resulting simpler sub problems are introduced and discussed interesting computational results are presented to show the capability of methodologies addressed in the book

this two volume monograph is a comprehensive and up to date presentation of the theory and applications of kinetic equations the second volume covers discrete velocity models of the boltzmann equation results on the landau equation and numerical deterministic and stochastic methods for the solution of kinetic equations

this book uses numerical analysis as the main tool to investigate methods in machine learning and neural networks the efficiency of neural network representations for general functions and for polynomial functions is studied in detail together with an original description of the

latin hypercube method and of the adam algorithm for training furthermore unique features include the use of tensorflow for implementation session and the description of on going research about the construction of new optimized numerical schemes

this book evaluates the development of the rhodesian air force during the second chimurenga or bush war 1966 1980 airpower in irregular conflict is effective at the tactical level because guerrilla warfare is not a purely military conflict the rhodesian air force was deployed in a war winning versus a supporting role as a result of the shortage of manpower to deal with insurgency and almost all units of the rhodesian security forces depended on its tactical effectiveness technical challenges faced by the air force combined with the rate of guerrilla infiltration and the misuse of airpower to bomb guerrilla bases in neighboring countries largely negated the success of airpower
